

Button Script Builder v1.2

User Guide

Overview

Button Script Builder allows you to customize an AutoHotkey v1.1.237 script by assigning images and text to three buttons. The program replaces placeholder values inside a template script and creates a new modified script ready to use.

Requirements

- AutoHotkey v1.1.237
 - Button Script Builder v1.2
 - Inkscape v1.4.4 (recommended for creating button graphics)
 - PNG button images
 - Hell Bent Has A Nice HB Button Maker
-

Preparing Button Images in Inkscape v1.4.4

For the best results, create your buttons at the same size used by the program.

Recommended Size

- **Width:** 120 pixels
- **Height:** 35 pixels

Inkscape Steps

1. Open Inkscape.
2. Create a new document.
3. Set the page size to **120 × 35 px**.
4. Design your button.
5. Keep important artwork away from the edges.
6. Export the image as a **PNG**.
7. Save the PNG inside the **BUTTON ICON** folder.

Tip:

- Use transparent backgrounds for cleaner-looking buttons.
- PNG is recommended because it supports transparency.

How to Use

Step 1 - Select a Script

Click **Select Script**.

Choose the AutoHotkey (.ahk) template that contains the placeholders:

__BTN1__
__BTN2__
__BTN3__

__TEXT1__
__TEXT2__
__TEXT3__

The selected script path will appear at the top of the window.

Step 2 - Choose Images

Click **Choose Image** for each button.

Supported formats:

- PNG
- JPG
- BMP

A preview of each image will be displayed.

If no image is selected, the default image **Backlog.png** is used.

Step 3 - Enter Button Text

Enter the text for each button.

Example:

Button 1 Text

Movies

Button 2 Text

Games

Button 3 Text

Music

These values replace the placeholders:

__TEXT1__
__TEXT2__
__TEXT3__

Step 4 - Save

Click **Save**.

The program will:

- Read the selected template script.
- Replace all image placeholders.
- Replace all text placeholders.
- Save a new script.

Example:

Original

MyScript.ahk

New file

MyScript_modified.ahk

The original script is never changed.

Template Example

Inside your AutoHotkey v1.1.237 script you should use placeholders like this:

```
Button1Image := "__BTN1__"
Button2Image := "__BTN2__"
Button3Image := "__BTN3__"

Button1Text := "__TEXT1__"
Button2Text := "__TEXT2__"
Button3Text := "__TEXT3__"
```

When saved, the builder automatically replaces these values.

Folder Structure

Example:

```
Button Script Builder
|
|— Button Script Builder.exe
|— Template.ahk
|— BUTTON ICON
|   |— Backlog.png
|   |— Select Script.png
|   |— Choose Image.png
|   |— Button1.png
|   |— Button2.png
|   |— Button3.png
|— filesFromButtonMakerDemo
|   |— Saved Buttons
```

Tips

- Use PNG images whenever possible.
- Keep all button images the same size.

- Avoid extremely large image files.
 - Store all artwork in the **BUTTON ICON** folder.
 - Test the generated script after saving.
-

Troubleshooting

"Please select a script first."

You attempted to save before selecting an AutoHotkey template.

Solution:

Click **Select Script** and choose your template first.

Images do not appear

Possible causes:

- Image was moved.
- Image was deleted.
- Unsupported file format.

Use PNG, JPG, or BMP images.

Button text does not change

Verify that your template contains the placeholders:

```
__TEXT1__  
__TEXT2__  
__TEXT3__
```

Images do not change

Verify that your template contains:

__BTN1__
__BTN2__
__BTN3__

Best Practices

- Keep backups of your template script.
 - Use descriptive names for button images.
 - Export graphics from Inkscape at 120 × 35 pixels.
 - Keep all project files together in one folder.
 - Use transparent PNG images for the best appearance.
-

Version: 1.2
